Components [mass %]	Slag 1	Slag 2	WA
CaO	42.44	41.22	41.3
SiO <sub>2</sub>	35.85	36.18	26.7
Al <sub>2</sub> O <sub>3</sub>	11.38	12.13	4.72
MgO	6.00	7.23	7.5
S <sup>2-</sup>	1.25	1.06	
TiO <sub>2</sub>	0.78	0.74	0.34
K <sub>2</sub> O	0.37	0.55	7.86
Na <sub>2</sub> O	0.22	0.39	1.95
Fe <sub>2</sub> O <sub>3</sub>	0.41		2.04
Fe		0.22	
MnO	0.255		0.63
Mn		0.21	
Cl <sup>-</sup>	0.014	0.04	0.054
SO <sub>3</sub>	0.17		0.68
Mn <sub>2</sub> O <sub>3</sub>	0.283		

- CaO/SiO<sub>2</sub> (Slag 1) > CaO/SiO<sub>2</sub> (Slag 2)
- Al<sub>2</sub>O<sub>3</sub> (Slag 2) > Al<sub>2</sub>O<sub>3</sub> (Slag 1)
- MgO (Slag 2) > MgO (Slag 1)

Slag 2 is finer

	Slag 1	Slag 2
Blaine value [cm <sup>2</sup> /g]	4000	4600

$$d_{50}(\text{WA}) = 146 \text{ um}$$

$\text{Ca}(\text{OH})_2$  disintegrates between 400 – 500 °C  
 $\text{Ca}(\text{OH})_2 \rightarrow \text{CaO} + \text{H}_2\text{O}$

# Results: Chemically bounded water (BW)

TAREC<sup>2</sup>

- Content
- 1) Introduction
  - 2) Experimental part
  - 3) Results of testing and discussion
  - 4) Conclusions and future work

Chemically bounded water Slag 1 ( $w/b = 0.45$ )

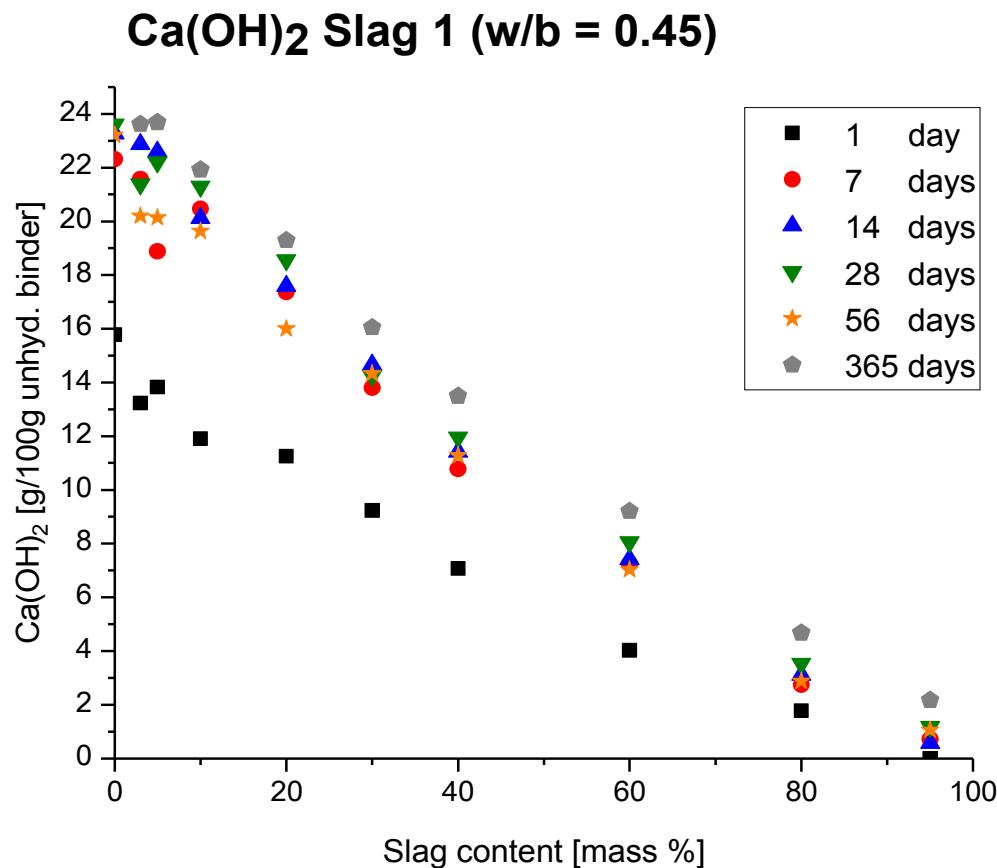

- BW removed from 40 - 600 °C

- Largest increase from day 1 to 7
- Decrease with higher slag content
- (Slag > 20 mass % and early age)

# Results: Calcium hydroxide (CH)

TAREC<sup>2</sup>

- Content  
1) Introduction  
2) Experimental part  
3) Results of testing and discussion  
4) Conclusions and future work

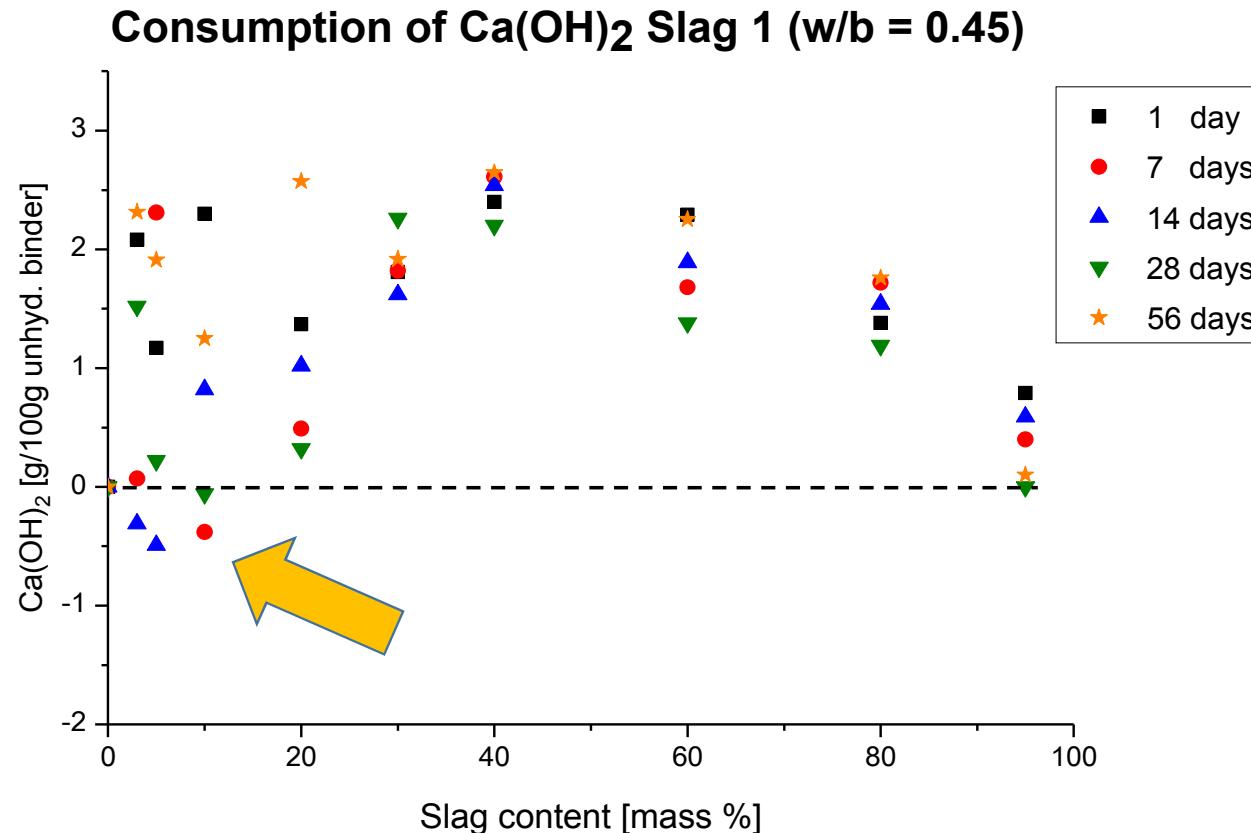

- CH decomposes from **360 - 550 °C** (tangential method was used)
- CH content decreases with increasing slag content
- CH content increases with time
- w/b = 0.35 lower CH content when slag content ≤ 20 %

# Results: Consumption of calcium hydroxide

TAREC<sup>2</sup>

- Content  
1) Introduction  
2) Experimental part  
3) Results of testing and discussion  
4) Conclusions and future work

Consumption = Ca(OH)<sub>2</sub> produced by cement (reference) - Ca(OH)<sub>2</sub> measured

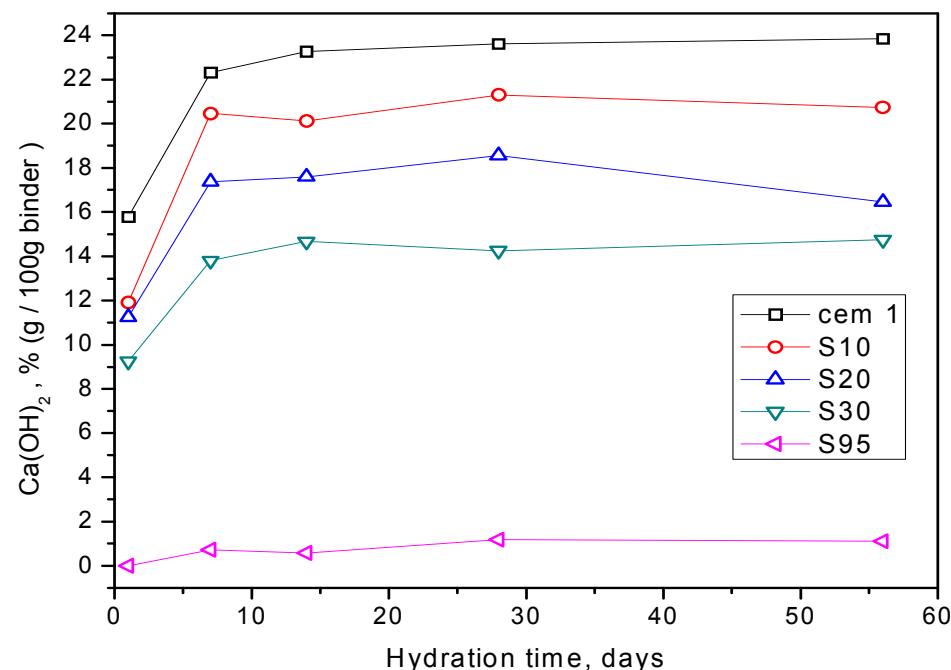

# Results: Calcium hydroxide slag (S) versus Woody ash (WA)

TAREC<sup>2</sup>

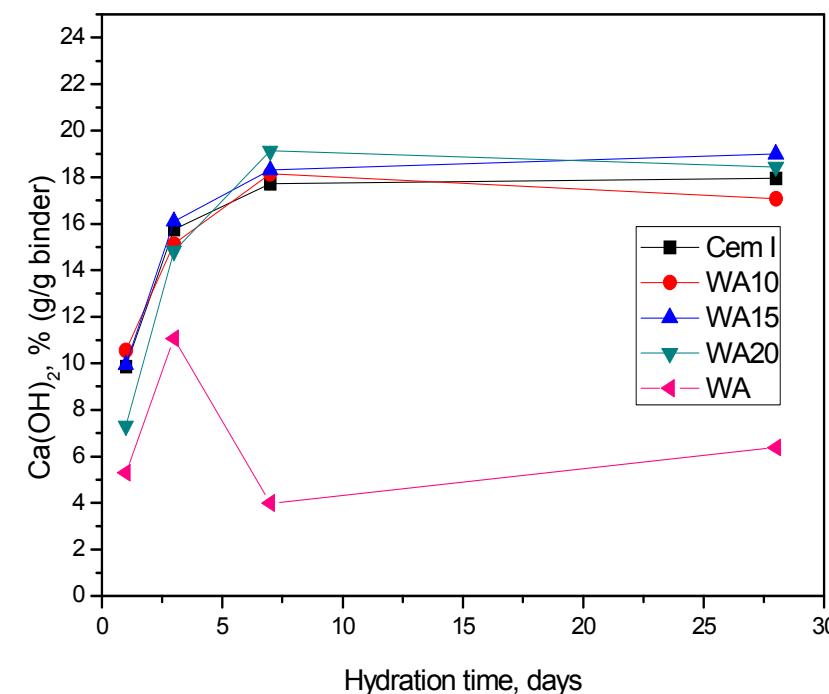

## Content

- 1) Introduction
- 2) Experimental part
- 3) Results of testing and discussion
- 4) Conclusions and future work

$\text{Ca(OH)}_2$ : mas.% per powder (cem I + slag 1)

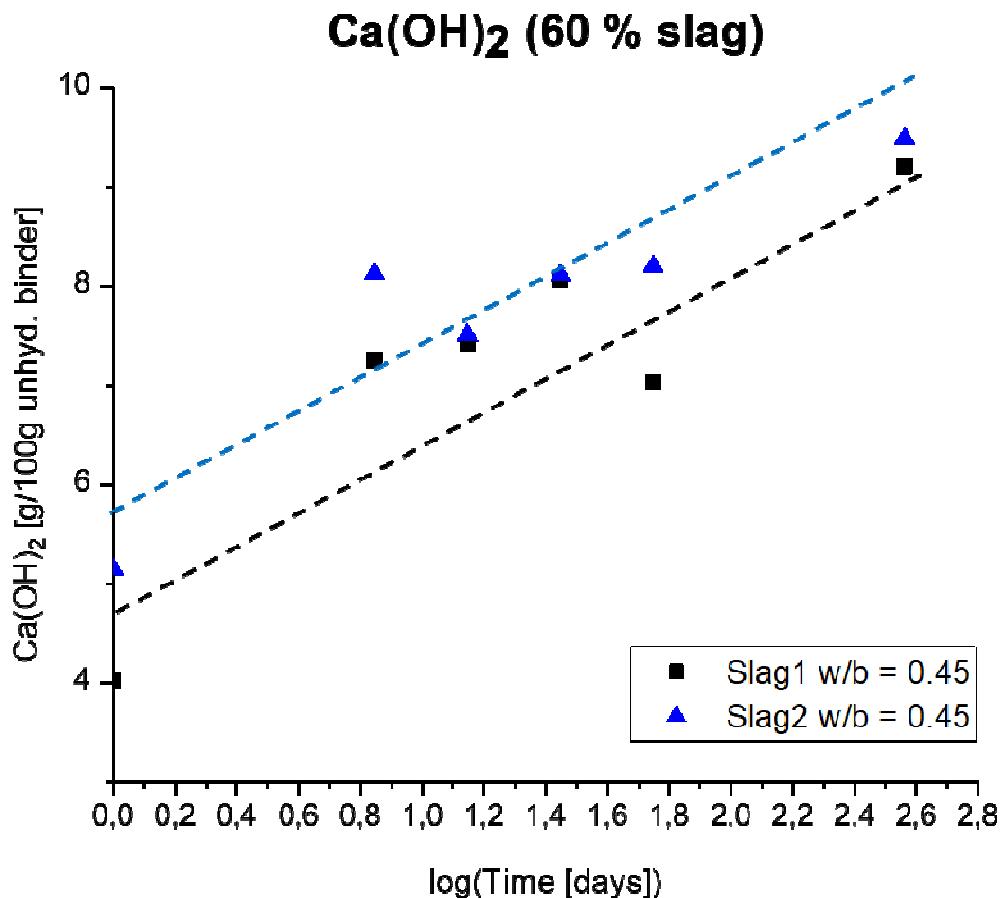

$\text{Ca(OH)}_2$ : mas.% per powder (cem I + WA)

# Results: Calcium hydroxide (CH)

TAREC<sup>2</sup>

- Content
- 1) Introduction
  - 2) Experimental part
  - 3) Results of testing and discussion
  - 4) Conclusions and future work

- Logarithmic scale
- CH content increasing linearly with log of time
- Slag 2 slightly higher CH content

# Results: Calcium hydroxide regression model

Regression model:

$$CH = \beta_0 + \beta_1 \cdot Slag + \beta_2 \cdot \log(t)$$

$CH = Ca(OH)_2$  [g / 100g unhyd. binder]

Slag = slag content of initial mixture [mass %]

$t$  = hydration time [days]

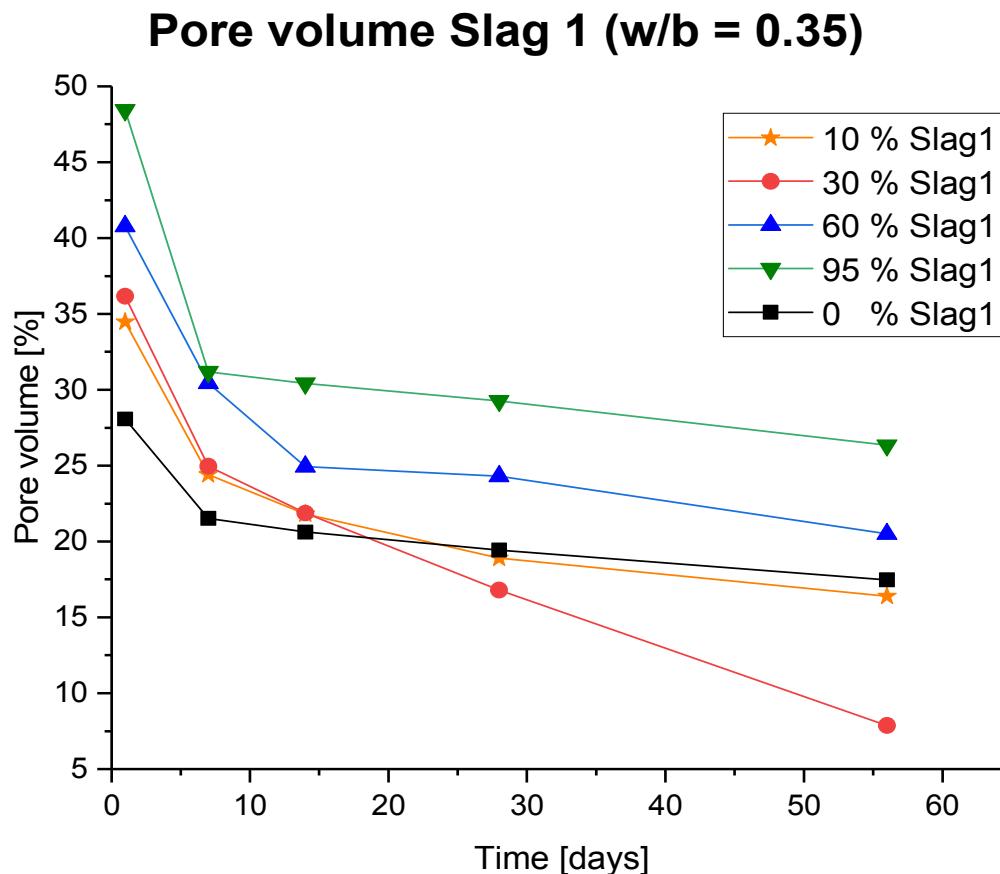

Slag	w/b	$\beta_0$	$\beta_1$	$\beta_2$	$R^2$
Slag1	0.35	15.56	-0.19	1.66	0.9556
Slag1	0.45	16.73	-0.22	1.83	0.9462
Slag2	0.45	18.14	-0.22	1.45	0.9604

Results up to 28 days included.

# Additional results: Pore volume

TAREC<sup>2</sup>

- Content
- 1) Introduction
  - 2) Experimental part
  - 3) Results of testing and discussion
  - 4) Conclusions and future work

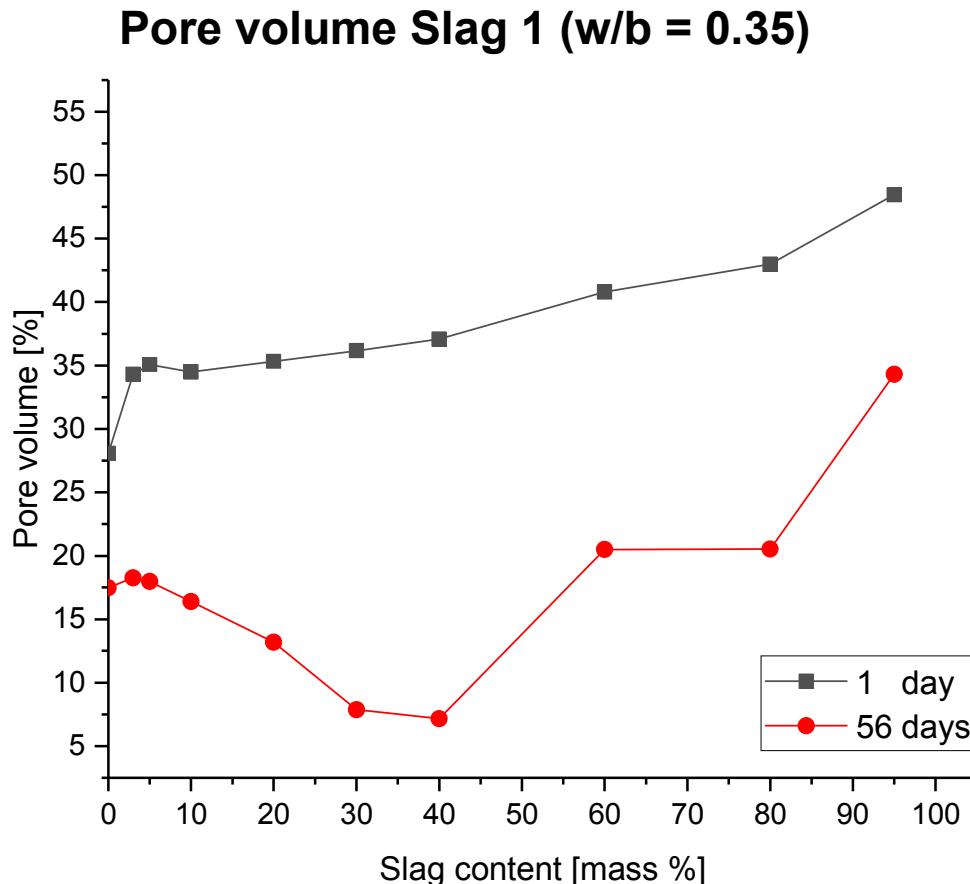

- Pore volume measured with pycnometer
- Decreasing pore volume with time
- Porosity increases for slag content > 30 %

# Additional results: Pore volume

TAREC<sup>2</sup>

- Content
- 1) Introduction
  - 2) Experimental part
  - 3) Results of testing and discussion
  - 4) Conclusions and future work

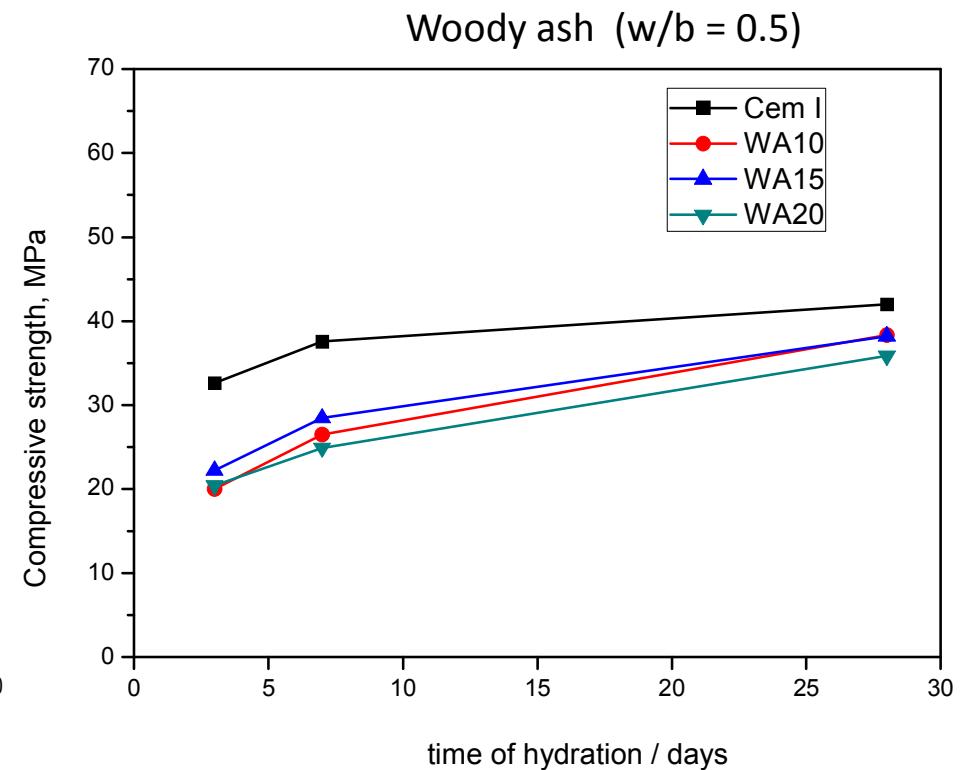

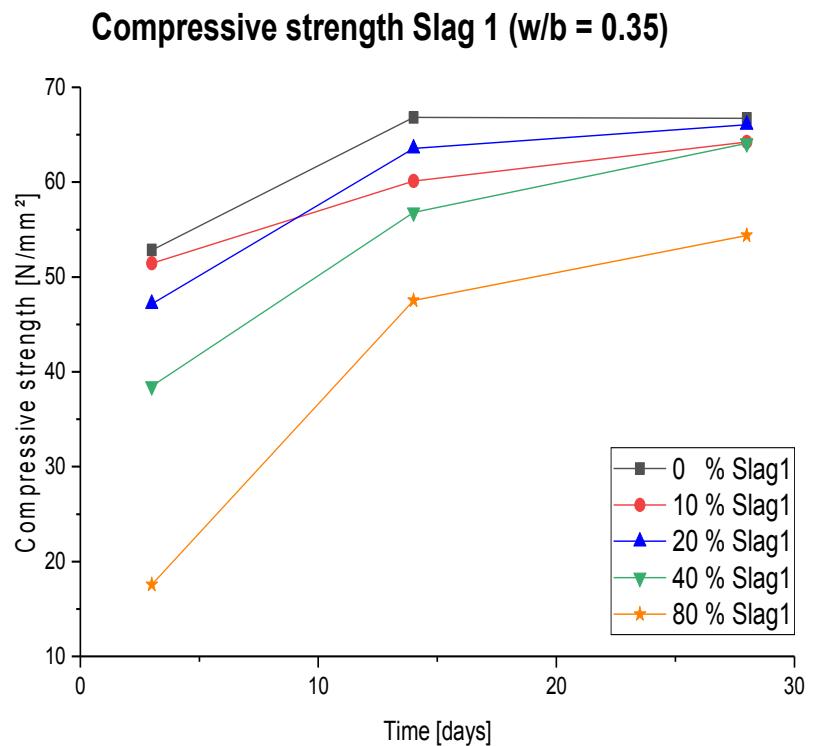

- After 1 day higher porosity with increasing exchange rate
- After 56 days the minimum calculated porosity is with 40 % exchange rate

# Additional results: Compressive strength

TAREC<sup>2</sup>

- Content
- 1) Introduction
  - 2) Experimental part
  - 3) Results of testing and discussion
  - 4) Conclusions and future work

# Conclusions

## Content

- 1) Introduction
- 2) Experimental part
- 3) Results of testing and discussion
- 4) Conclusions

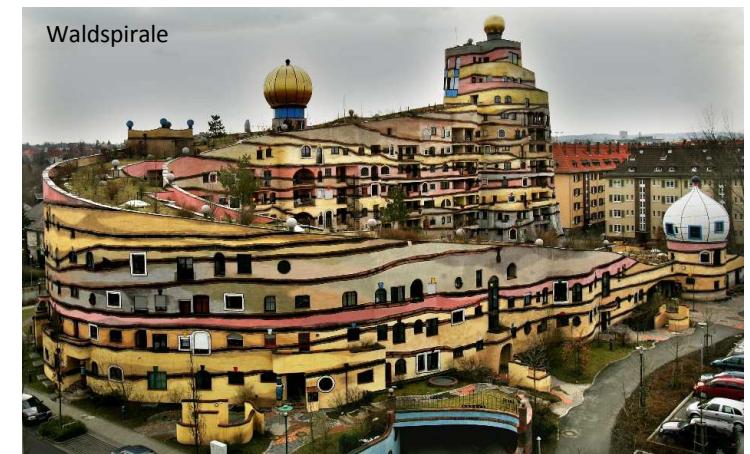

- Ca content of slag and WA are nearly the same
- CH consumption for WA has almost negligible up to 20%
- Reactivity of WA differs from slag
- Pore structure depending on replacement ratio
- For WA replacement rate up to 20% has constant impact on strength

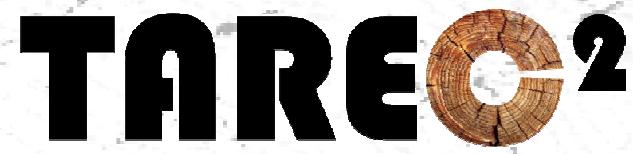

# Greetings from Darmstadt!
